

#### **VitriFender** - for iPhone, iPad and iPad mini

When I think about what's important about my device and how I use it. It's the screen, everything defers to the screen. So when I recently stumbled upon a super hard form of volcanic glass on my recent trek to the South Pacific, I knew I'd found the substance to protect my precious screen and connection to the outside world. Carved from gigantic slabs of glass, the VitriFender is beautifully thin, yet incredibly strong, just like me! It's resistant to supersonic blows by a hammer, ear-piercing 'nail on a chalkboard' scratches by a nail and of course meteor showers, and also repulses the oil in my Tactino's hands, leaving the screen sparkling for longer and as sensitive to my delicate touch as ever.

Coupled with the magnificent MagnaTuff or tremendous Telefender, I know wherever I am, my device is up to the task and protected during my travels.

#### Specification

- Super slim 0.4mm thick and made with chemically treated, transparent tempered glass.
- Surface hardness of 8~9H which is three times stronger than PET film, even knives and keys won't scratch VitriFender.
- VitriFender has an oleophobic coating that reduces fingerprints and other contaminants whilst also making the screen easier to clean.
- Coated with strong silicon adhesive for easy installation.
- Features advanced anti-shatter technology, that breaks under extreme pressure into small pieces which are not sharp, making it safe.

#### **CAUTION**

As this is a glass product, please note that the edges of the glass are the most vulnerable areas. I highly recommend that you use a case along with your VitriFender to avoid chipping or cracking the edges of your VitriFender. When removing for re-use, the adhesive properties might wear off to an extent where the VitriFender will not adhere to the device. It is not recommended to reuse the VitriFender once it has been applied. Using excessive force when installing or removing the screen protector may damage the product.
